CASE STUDY

Automating Contract Data Collection Across Six US Jurisdictions for LandDesign

An automated contract intelligence platform, documented through its challenges, approach and outcome.

Python · Playwright · FastAPI · Next.js · PostgreSQL

Project Overview

LandDesign required a more efficient way to collect and analyse awarded contract information across multiple US jurisdictions. Relevant contract records, blueprints and project details were spread across different public sources, making research time-consuming and limiting centralised visibility.

We developed an automated contract intelligence platform that consolidates this data into structured Excel spreadsheets and a centralised web dashboard, giving the team a foundation for data-driven market analysis and opportunity assessment.

The Challenges

Managing contract intelligence across multiple jurisdictions presented several obstacles.

01 Fragmented Data Sources
Contract records and supporting documents were distributed across multiple government websites and information systems.

02 Manual Research Overhead
Collecting, extracting and organising contract information required repetitive effort.

03 Limited Market Visibility
Reviewing jurisdictions independently made cross-market comparisons more difficult.

04 Inconsistent Data Structures
Variations in source formats complicated the consolidation and analysis of contract records.

05 Delayed Opportunity Discovery
Manual research could delay the identification of relevant awarded projects.

06 Limited Scalability
Expanding research coverage increased the operational effort required to maintain the information.

07 Underutilised Business Intelligence
Raw contract records required structured organisation to support meaningful research and strategic decisions.

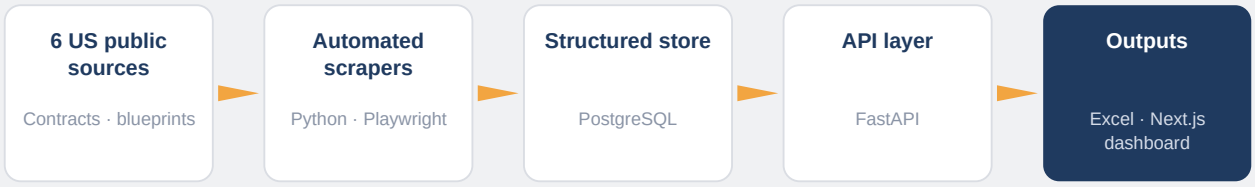
THE GOAL

Streamline contract research, improve access to project information, and provide a foundation for data-driven market analysis and opportunity assessment.

The Approach

We developed an automated contract intelligence platform that consolidates awarded contract data, associated blueprints and relevant project details from six US jurisdictions.

PLATFORM FLOW



Illustrative overview of how data moves from public sources to the research team.

WHAT WE BUILT

Automated Contract Data Collection

Automated scraping and aggregation workflows collect contract records and supporting project information from multiple jurisdictional sources.

Structured Excel Reporting

Collected information is organised into Excel spreadsheets for efficient record review, filtering, comparison and further analysis.

Centralised Web Dashboard

A unified interface for aggregated contract intelligence, with no need to navigate each source independently.

Blueprint & Project Documentation

Blueprints and project details are collected alongside contract records for added context and preliminary opportunity assessment.

Cross-Jurisdiction Intelligence

Six US jurisdictions in one research workflow, a foundation for comparing project activity, geographic markets and awarding organisations.

Operational Efficiency

Repetitive collection and organisation tasks are automated, so researchers can focus on evaluating contracts and interpreting business information.

THE SYSTEMS BEHIND THE INTELLIGENCE

- Automated Data Collection
- Structured Data Management
- Excel Reporting
- Blueprint Aggregation
- Web Dashboard
- Scalable Architecture

Key outcomes

RESULTS DELIVERED

An automated contract intelligence system that consolidates information from six US jurisdictions into a centralised research resource.

6	100%	Zero
US jurisdictions continuously consolidated	automated research workflow	repetitive data gathering tasks

01 Consolidated Research
Contract information from six jurisdictions is accessible through a unified workflow.

02 Reduced Manual Effort
Automated collection minimises repetitive data gathering and organisation.

03 Improved Data Accessibility
Structured Excel spreadsheets and a centralised dashboard simplify access to contract information.

04 Enhanced Opportunity Assessment
Contract records and supporting documents provide a basis for evaluating relevant projects.

05 Broader Market Visibility
Consolidated information supports comparisons across covered jurisdictions.

06 Future Business Intelligence
Structured records provide a foundation for contractor analysis, market research and opportunity prioritisation.

The immediate value is a more efficient and centralised research process. Further business impact can be assessed by measuring research time saved, relevant opportunities identified, and the contribution of contract intelligence to business development.

TECHNOLOGY USED

Automated Data Collection · Document Aggregation · Data Structuring · Web Development · Business Intelligence

Want results like these for your business?

Tell us about your data bottlenecks and operational challenges. We'll show you the exact automated architecture we would build for you.
